

UNIVERSITI TEKNOLOGI MARA

**SINGLE MODE RING RESONATOR
FOR BANDPASS FILTER
APPLICATIONS**

NORFISHAH AB WAHAB

Thesis submitted in fulfillment
of the requirements for the degree of
Doctor of Philosophy

Faculty of Electrical Engineering

January 2015

I certify that a panel of examiners has met on 18th November 2014 to conduct the final examination of Norfishah Binti Ab Wahab on her Doctor of Philosophy thesis entitled, “Single Mode Ring Resonator for Bandpass Filter Applications” in accordance with Universiti Teknologi MARA Act 1976 (Akta 173). The Panel of Examiners recommends that the student be awarded the relevant degree. The panel of Examiners was as follows:

Datin Shah Rizam Mohd Shah Baki, Ir PhD
Professor
Faculty of Electrical Engineering
Universiti Teknologi MARA
(Chairman)

Mohd Tarmizi Ali, PhD
Professor
Faculty of Electrical Engineering
Universiti Teknologi MARA
(Internal Examiner)

Mohamad Kamal A Rahim, PhD
Professor
Faculty of Electrical Engineering
Universiti Teknologi Malaysia
(External Examiner)

Gaetan Prigent, PhD
Associate Professor
Faculty of Electrical Engineering
National Polytechnic Institute of Toulouse
France
(External Examiner)

SITI HALIJJAH SHARIFF, PhD
Associate Professor
Dean
Institute of Graduate Studies
Universiti Teknologi MARA
Date: 29 February 2015

AUTHOR'S DECLARATIONS

I declare that the work in this thesis entitled was carried out in accordance with the regulations of Universiti Teknologi MARA. It is original and is the results of my own work, unless otherwise indicated or acknowledged as referenced work. This thesis has not been submitted to any other academic institution or non-academic institution for any degree or qualification.

I, hereby, acknowledge that I have been supplied with the Academic Rules and Regulations for Post Graduate, Universiti Teknologi MARA, regulating the conduct of my study and research.

Name of Student	:	Norfishah Binti Ab Wahab
Student I.D. No.	:	2010438964
Programme	:	EE990
Faculty	:	Electrical Engineering
Thesis Title	:	Single Mode Ring Resonator for Bandpass Filter Applications
Signature	:	
Date	:	January 2015

ABSTRACT

Technology advancements in microwave systems demand for high performance electronic devices. This leads to the creation and development of new microwave filter topologies to achieve better selection and control of response. Ring based filter topologies become immediately attractive options as they offer dual resonance in their response which will ensure high selectivity and physical compactness of the filter. However, in some cases, the ring filters do not come with complete mathematical synthesis, making them difficult to design and to be generalized at higher order. This thesis introduces a single mode ring resonator, fed via one of the resonator's quarter-wavelength coupled-line for simplification, with less control parameters. A global synthesis is developed to fix the transmission zeros and experiments are conducted to prove the validity of the synthesis and subsequently can be generalized for higher-order filters. To prove this concept, higher-order filters were realized by cascading the single mode ring to form multiple cells and additional coupled-lines were introduced in the structure to create additional poles. The global synthesis of the single mode ring was applied to demonstrate the flexibility of the single mode ring topology and its synthesis. Higher-order filters of up to 5th-order were implemented in the range of 1 GHz to 2 GHz to give a different range of fractional bandwidth between 10% - 26%. Further advancement on the application of single mode ring topology is presented in this thesis for reconfigurable filter application. By manipulating the electrical length of the ring lines using external tunable elements, the electrical length of the ring was varied, hence, shifting the frequency response to a desired position. The reconfigurable filter with its tunable scheme synthesis was developed to control the frequency response at arbitrary center frequency. Based on this reconfigurable concept and its synthesis, two reconfigurable designs were achieved using two different techniques. The first technique made use of lumped capacitors and was successfully reconfigured from 2 GHz to 984.4 MHz; while miniaturisation achieved up to 71% as compared to the conventional filter designed directly at 1 GHz. The second design made use of varactor-diodes and shifted the resonance frequency from 1.10 GHz to 1.38 GHz, spreading over 280 MHz frequency range to give 25% tuning range with fractional bandwidth below 9%. All the filters were realized using microstrip technology. The simulated and measured results are then presented and compared to demonstrate the excellent performance of the proposed filters.

ACKNOWLEDGEMENTS

It is both my pleasure and obligation to acknowledge generous people who have provided me with guidance and inspire me to make this happen. I would like to thank my supervisor, Dr. Mohd Khairul bin Mohd Salleh for valuable guidance, critics, encouragement and support throughout this program. It is truly impossible to express my feeling of gratitude in mere words.

I would also like to acknowledge my appreciation to Professor Dr. Zaiki Awang who is my co-supervisor, for his continuous support and advices in completing this thesis. My friends and fellow colleagues, thank you for being good teammates throughout this course of work. Your assistance, views, and tips are treasured in my heart.

Finally, this thesis is dedicated to my family for being instrumental, cherish, motivating and more importantly for their patience throughout this period. To them, I remain grateful and nor can I ignore them from my memory. I would never have been able to complete this thesis when I did if ever at all.
